

Internal Transfer Digital Journey

One-Point Employee Portal | Modern Admin Panel | Next.js + Node.js + PostgreSQL

DOCUMENT CONTROL	DETAIL
Document status	Draft for stakeholder review
Version / date	1.4 27 September 2026
Business owner	To be confirmed by the organisation
Solution scope	Employee internal transfer journey, administration, workflow and downstream task orchestration
Delivery approach	Phased implementation, subject to discovery, policy confirmation and integration validation

Purpose

This Statement of Work defines the full proposed scope for a role-based Employee Internal Transfer Digital Journey. It covers employee transfer initiation and tracking, modern administration, organisation master data, vacancy/capacity management, user provisioning, manager and HR approvals, payroll/IT/facilities task orchestration, document handling, notifications, reporting, security and auditability.

End-to-end journey

INITIATE	REVIEW	VALIDATE	EXECUTE	COMPLETE
Employee	Reporting Manager / Receiving Manager	HR	HR / Payroll / IT / Facilities	Employee notified

The portal is the common entry point and progress view. Approval decisions and downstream activities remain attributable to the responsible business users and enterprise systems.

1. Business context and objectives

Employees currently coordinate with managers, HR, payroll, IT and facilities across multiple touchpoints to complete an internal transfer. The proposed solution centralises request capture, approval routing, organisation assignment, vacancy validation, downstream task orchestration and status visibility within the One-Point Employee Portal.

- Enable employees to submit internal transfer requests against configured departments, locations, designations and vacancies.
- Give each user an individual login and a role-aware view of assigned employees, requests and tasks.
- Provide traceable Reporting Manager, optional Receiving Manager and HR review stages.
- Provide controlled downstream HR, payroll, IT and facilities activities after approval.
- Provide a modern Super Admin Panel for organisation setup, user management, vacancies and transfer administration.
- Reduce manual follow-up through notifications, clear ownership, exception handling, dashboards and audit logs.

2. Scope summary

- Modern responsive Admin Panel and role-based dashboards.
- User account creation with automatically generated unique User ID and temporary password.
- Location, department/business unit and designation master management.
- Employee, Reporting Manager, HR, IT and Facilities/Admin user management and assignment.
- Vacancy creation and capacity/headcount management.
- Employee transfer request initiation, approval, validation, execution and closure.
- HR organisation metadata update and payroll task assignment.
- Transfer/organisation document upload and controlled access.
- IT and facilities task assignment and completion tracking.
- Notifications, operational reporting, audit logs and exception handling.

3. Role model and access principles

Every user will have an individual authenticated account. Access will be role-based and scope-based. Users will see only the employees, requests, tasks and organisational information assigned or permitted to them. Super Admin will have cross-organisation administrative visibility, subject to company policy.

ROLE	PRIMARY RESPONSIBILITY	VISIBILITY / SCOPE
Super Admin	Organisation setup, user administration, vacancy/capacity management and transfer administration.	All configured organisational data and transfer workflows.
Employee	Initiate and track own internal transfer requests.	Own profile, permitted vacancies and own transfer history.
Reporting Manager	Review transfer requests for assigned employees.	Assigned employees and related requests.
Receiving Manager (optional)	Review proposed incoming transfers.	Requests routed to the target team/organisation scope.
HR	Eligibility validation, target organisation confirmation, documents and downstream coordination.	Assigned location/organisation employees and requests.
IT	Execute transfer-related access/provisioning tasks.	Assigned IT tasks and minimum required employee information.
Facilities / Admin	Execute workplace/location-related tasks.	Assigned facilities tasks and relevant transfer information.

4. Modern Admin Panel

4.1 User experience and layout

- Modern, professional and responsive interface aligned with the organisation's portal design system.
- Role-aware left navigation/top navigation with only permitted modules visible.
- Dashboard cards for key operational indicators such as total employees, active transfers, pending approvals, HR reviews, blocked tasks and open vacancies.
- Searchable, sortable and filterable data tables with pagination and clear status badges.
- Consistent create/view/edit forms with inline validation, required-field indicators and clear success/error feedback.
- Confirmation dialogs for sensitive actions such as deactivation, reassignment and credential reset.
- Responsive desktop and tablet layouts with accessibility support.
- Clear loading, empty, no-access and error states.

4.2 Admin modules

MODULE	CORE FUNCTIONS
Dashboard	Operational summary, pending actions, vacancy overview and transfer status indicators.
Users	Create/manage Employee, Reporting Manager, HR, IT and Facilities/Admin accounts.
Locations	Create, edit, activate/deactivate locations.
Departments	Create and maintain departments/business units.
Designations	Create and maintain designations/job positions.
Vacancies	Create vacancies, configure capacity and manage vacancy status.
Transfers	View, filter, administratively reassign/intervene where policy permits.
Documents	View authorised transfer/organisation document metadata and access.
Audit Logs	Search/filter auditable user, configuration and workflow actions.

5. User account provisioning and login

5.1 Account creation

When Super Admin creates an Employee, Reporting Manager, HR, IT or other enabled user, the application will provision an individual login account as part of the creation flow.

- Generate a unique User ID according to an agreed company naming/numbering convention.
- Generate a strong temporary password automatically.
- Validate duplicate user/employee rules before account creation.
- Create the user account and applicable organisational profile in a controlled transaction.
- Show the generated User ID and temporary password only to an authorised administrator as part of the successful creation result, subject to company security policy.
- Support an approved secure mechanism for delivering initial credentials to the new user, depending on available enterprise email/SMS/identity services.
- Require the user to change the temporary password on first login.
- Store passwords only as secure password hashes; plaintext passwords must not be retained in PostgreSQL, logs, reports or audit records.

5.2 Account lifecycle

- Account statuses: Pending Activation, Active, Locked and Inactive/Deactivated.
- Administrator-initiated credential reset generates a new temporary password and requires password change on next login.
- Support failed-login protection, session timeout and password policy according to the organisation's security standard.

- Audit account creation, activation/deactivation, credential reset, lock/unlock and first-login password change events without storing plaintext passwords.

5.3 Account creation flow

STEP	SYSTEM BEHAVIOUR
1. Select role	Super Admin selects Employee, Reporting Manager, HR, IT or another enabled role.
2. Enter profile	Capture required identity, employment, location and organisational assignment information.
3. Validate	Validate duplicate account rules and required role/location/department/manager/HR mappings.
4. Create	Create the user and relevant business profile.
5. Generate credentials	Generate unique User ID and strong temporary password.
6. Deliver	Present/deliver initial credentials through the approved secure mechanism.
7. First login	Require the user to replace the temporary password.
8. Audit	Record provisioning and security events without plaintext password values.

6. Functional scope by role

6.1 Super Admin

- Create, edit, activate and deactivate Locations.
- Create and manage Departments / Business Units.
- Create and manage Designations / Job Positions.
- Create Vacancies with department, designation, location, capacity/headcount and status.
- Create HR users and assign them location-wise and/or by organisational scope.
- Create IT users/teams and assign them location-wise.
- Create Facilities/Admin users and assign them location-wise where applicable.
- Create Reporting Managers and map them to the appropriate HR/business hierarchy.
- Create Employees with employee ID, department, designation, location, Reporting Manager and assigned HR.
- Generate user login credentials during account creation.
- Manage user-role mappings and organisational relationships.
- View all employees, vacancies, transfer requests, workflow tasks and audit history.
- Reassign or administratively intervene in transfer workflows where company policy permits.

6.2 Employee

- Login with individual credentials and change temporary password on first login.
- View current employee profile including department, designation, location and Reporting Manager.
- Browse eligible internal vacancies subject to company visibility rules.
- Submit a transfer request with proposed department/business unit, location, designation/role, vacancy, effective date and optional reason.
- Receive a unique transfer reference number and submission confirmation.
- Track overall status, stage timeline, pending stakeholder actions, decision reasons and completion dates.
- Respond to clarification requests where permitted.
- View own current and historical transfer requests.

6.3 Reporting Manager / Receiving Manager

- View all employees assigned to the manager within authorised scope.
- View transfer requests requiring manager action.
- Review requested department, location, designation, vacancy, effective date and employee reason.
- Approve, reject with mandatory reason, or request clarification.
- Add comments/remarks and view previous decisions.
- Receiving Manager approval can be enabled as a configurable company policy.

6.4 HR

- View assigned employees and requests based on location and/or organisational scope.
- Validate employee eligibility and proposed department, location, designation, vacancy and effective date.
- Validate vacancy/capacity according to agreed business rules.
- Approve HR validation, reject with reason, or return the request for additional information.
- Assign or update organisation metadata required for the transferred employee.
- Assign the applicable new payroll/payroll configuration task.
- Upload transfer documents and organisation documents.
- Initiate/assign applicable payroll, IT and facilities tasks.
- Monitor downstream task completion and complete HR activities before closure.

6.5 IT

- View IT tasks assigned through location/workflow routing.
- View only employee and transfer information required for the assigned task.
- Record access provisioning/removal/modification, email/group changes and device/asset activities where applicable.
- Add comments and completion evidence/reference.
- Mark tasks In Progress, Completed or Blocked with reason.

6.6 Facilities / Admin

- View assigned location-transfer tasks.
- Manage workspace, seating, building/access-card, asset movement or other agreed facilities actions.
- Add comments, evidence and task status.

7. Organisation hierarchy and assignment model

The solution will maintain organisational relationships required for automatic workflow routing.

Super Admin -> Location -> HR -> Reporting Manager -> Employee

Location-based IT and Facilities teams can be configured alongside this hierarchy. An employee profile should support Department, Designation, Location, Reporting Manager and assigned HR.

ENTITY	KEY RELATIONSHIPS
Employee	Department, designation, current location, Reporting Manager, assigned HR.
Reporting Manager	Assigned employees, department/business scope and related HR mapping where required.
HR	Location and/or organisational scope.
IT	Location scope and assigned transfer tasks.
Facilities	Location scope and assigned transfer tasks.
Vacancy	Department, designation, location, capacity, allocated/filled count and status.

8. Vacancy and capacity management

Super Admin can configure internal vacancies and their capacity. The workflow will validate vacancy availability according to company policy before final transfer confirmation.

FIELD	DESCRIPTION
Vacancy reference	Unique vacancy identifier.
Department / Business Unit	Target organisational unit.
Designation / Job Position	Target role.
Location	Target work location.
Capacity	Configured headcount/capacity.
Allocated / Filled	Number already allocated or filled.
Available	Remaining capacity derived or controlled according to agreed rules.
Status	Open / Full / On Hold / Closed.

- Capacity reservation timing (submission, approval or HR validation) will be confirmed during discovery.
- The system should prevent over-allocation according to the agreed concurrency and reservation rules.
- Vacancy closure or hold behaviour for in-progress transfer requests will be defined with HR.

9. Proposed end-to-end transfer workflow

STEP	OWNER	EXPECTED OUTCOME
1. Initiate	Employee	Select eligible vacancy/proposed transfer details, review current information and submit.
2. Current manager review	Reporting Manager	Approve, reject with reason, or request clarification.
3. Receiving review	Receiving Manager, if configured	Confirm acceptance into target team/organisation.
4. HR validation	HR	Check eligibility, target organisation, vacancy/capacity, effective date and required downstream actions.
5. Execute	HR / Payroll / IT / Facilities	Update organisation metadata and complete applicable downstream tasks.
6. Verify	HR / Portal	Verify all mandatory tasks/evidence are complete.

STEP	OWNER	EXPECTED OUTCOME
7. Close	Portal / accountable owner	Mark Completed and notify employee.

10. Status and exception model

STATUS	MEANING
Draft	Employee has not submitted; optional if draft saving is enabled.
Submitted / Pending approval	Request received and awaiting one or more reviewer decisions.
Information required	Employee or another owner must provide clarification.
Manager approved	Required manager approval completed; next configured stage is pending.
HR review	HR is checking eligibility, target organisation, vacancy and effective date.
Approved / In progress	Transfer authorised; mandatory downstream tasks are underway.
Blocked	One or more mandatory activities failed or require manual intervention.
Completed	All mandatory actions have completed and final confirmation has been sent.
Rejected / Withdrawn	Request stopped with a recorded reason; withdrawal rules to be confirmed.

A request must not be shown as Completed merely because it has been approved. Completion requires all configured mandatory downstream activities to satisfy the completion rule.

11. HR organisation metadata and payroll handling

- HR can update or assign the agreed target organisation metadata after validation/approval.
- Organisation metadata fields and the authoritative source system will be confirmed during discovery.
- HR can assign the new payroll/payroll configuration activity required by the transfer.
- The portal coordinates payroll handoff/status; payroll calculations, compensation rules and statutory processing remain with the organisation's authoritative payroll system.
- Payroll task status and completion reference can be tracked as part of the transfer workflow.

12. Document management

- HR can upload authorised transfer documents and organisation documents.
- Documents can be linked to the relevant employee and/or transfer request.
- Document access follows role and organisational scope; users do not automatically receive access to all employee documents.
- Document metadata includes category/type, uploader, upload timestamp and employee/request reference.
- Allowed file types, maximum size, storage, malware scanning, retention, download/view rules and deletion policy will be confirmed during discovery.
- Document upload and authorised document actions are auditable.

13. Audit log and traceability

All material actions performed by every role will be auditable. The audit record should capture actor/user, role, action, affected entity/request, timestamp, relevant previous/new values, status/state and remarks where applicable.

- User creation, activation/deactivation, assignment and credential reset events.
- Location, department, designation and vacancy configuration changes.
- Employee hierarchy changes including Reporting Manager and HR assignments.
- Transfer submission, withdrawal and clarification actions.
- Manager/receiving-manager approvals and rejections.
- HR validation, vacancy allocation and organisation metadata updates.
- Payroll, IT and facilities task assignment, reassignment and completion.
- Document upload and authorised document actions.
- Administrative interventions and final transfer completion.

- Plaintext passwords must never be written to the audit log.

14. Notifications and reporting

- Notifications for account creation/activation where approved, transfer submission, action required, clarification, approval/rejection, downstream task assignment, delays/blockage and final completion.
- Role-specific dashboards and worklists for assigned employees, requests and tasks.
- Operational reporting for request volume, current stage, pending owner, overdue tasks, vacancy utilisation and completion time.
- Super Admin reporting across authorised organisation scope; other roles receive restricted reporting according to policy.

15. Proposed technical architecture

The portal experience will be implemented in Next.js. Node.js services will provide business validation, role-based authorisation, organisation configuration, vacancy management, transfer request management, approvals, task orchestration, notifications and integration endpoints. PostgreSQL will store transactional workflow data, assignments and audit records. Existing enterprise systems remain authoritative for employee, payroll, access and facilities data where applicable.

LAYER	PROPOSED RESPONSIBILITY
Next.js frontend	Modern responsive Admin Panel; employee journey; dashboards/worklists; vacancy browsing; request timeline; document interfaces; role-aware navigation.
Node.js backend	Authentication integration, RBAC, business validation, organisation hierarchy, vacancy/capacity logic, account provisioning, approval workflow, orchestration, APIs, adapters and notifications.
PostgreSQL	Users/roles and mappings, organisation master data, vacancies, transfer requests, approvals, task state, document metadata, integration references and audit trail.
Enterprise integrations	Agreed identity, HR, payroll, IT/service-management, facilities, email/SMS and other approved interfaces or controlled handoffs.

16. Security and non-functional requirements

- Authentication: individual user accounts using the approved identity model; temporary password change on first login where local credentials are used.
- Authorisation: role-based and scope-based access with least privilege enforced in both UI and APIs.
- Credential security: strong password hashing; no plaintext password persistence; secure reset and failed-login protection.
- Transport and data protection: encrypted transport and protection of personal/employee information.
- Auditability: protected audit records for material decisions, configuration changes and security events.
- Reliability: recoverable integration failures, clear error ownership and safeguards against duplicate downstream execution.
- Privacy: employee and document access restricted to authorised roles and organisational scope.
- Accessibility/usability: align with portal design and organisational accessibility standards.
- Performance, availability, backup, retention and monitoring targets will be confirmed during discovery.

17. Delivery workstreams and deliverables

WORKSTREAM	DELIVERABLES
Discovery and design	Confirmed workflow, role/permission matrix, hierarchy, approval matrix, eligibility/capacity rules, credential policy, document policy, integration inventory, field mapping, UX wireframes and acceptance scenarios.
Next.js frontend	Modern Admin Panel, employee journey, vacancy browsing, configuration screens, dashboards, reviewer worklists, HR/IT/facilities task views, document UI and progress timeline.
Node.js and PostgreSQL	RBAC, account provisioning, master data, vacancy/capacity APIs, transfer APIs, approval routing, HR review, orchestration, persisted workflow state, audit log, notifications and error handling.

WORKSTREAM	DELIVERABLES
Integrations	Agreed interfaces/handoffs for identity, HR, payroll, IT, facilities and notification services.
Quality and release	Functional/security/RBAC test evidence, UAT support, deployment runbook, administrator guidance and handover documentation.

18. Assumptions and dependencies

- The organisation confirms whether authentication uses local credentials, enterprise SSO/identity provider, or a hybrid model.
- The organisation provides the approved User ID convention, password policy and initial credential delivery method.
- HR provides eligibility criteria, approval sequence, hierarchy rules, vacancy/capacity policy, effective-date rules and completion criteria.
- System owners confirm APIs, credentials, sandbox/test environments, interface specifications and data ownership.
- Payroll calculations and compensation policy remain with authoritative payroll/HR systems; the portal coordinates the applicable transfer task/handoff.
- Document storage, retention, classification, allowed types and access policy are confirmed before implementation.
- Receiving Manager approval, Facilities involvement, withdrawal behaviour and escalation rules remain configurable pending policy confirmation.
- Notification channels, hosting, logging and deployment environments already exist or are provided separately unless included through change control.

19. Out of scope

- Redesign or replacement of underlying HR, payroll, IT service-management or facilities platforms.
- Building a new payroll calculation engine, identity provider or enterprise master-data platform.
- External recruitment, cross-company transfer, immigration or relocation benefit processing unless separately agreed.
- Historical data migration, bulk backfill and custom integrations not identified and approved during discovery.
- Advanced workforce planning or predictive vacancy forecasting unless separately agreed.

20. Roles and responsibilities

PARTY	RESPONSIBILITY
Organisation / Product Owner	Approve scope and policies; provide timely decisions, access, environments and UAT sign-off.
Super Admin / Business Admin	Maintain approved organisation configuration, users, mappings and vacancies after handover.
HR and business stakeholders	Define eligibility, hierarchy, approval roles, vacancy/capacity rules, data ownership, documents, exceptions and completion rules.
Security / Identity stakeholders	Confirm authentication, User ID, password, credential delivery and account-security requirements.
System owners	Provide interface specifications, test data, access and integration support.
Delivery team	Design, build, configure, integrate, test, document and support UAT for the agreed scope.

21. Proposed delivery phases

PHASE	EXIT OUTPUT
1. Discovery and solution design	Signed-off requirements, role/permission matrix, process map, hierarchy model, security/account model, interface inventory and prioritised backlog.
2. Build and integration	Modern Admin Panel, employee journey, user provisioning, vacancy management, workflow services and agreed downstream connections in a test environment.
3. System testing and UAT	Functional, RBAC/security and integration test results; resolved priority defects; business acceptance against agreed scenarios.
4. Deployment and handover	Approved release, operational runbook, administrator guidance, knowledge transfer and hypercare plan.

Dates, effort, team composition, commercials and any support period are intentionally left for a separately approved project plan following discovery.

22. Acceptance criteria

- Super Admin can access a modern role-aware Admin Panel and manage the agreed master data and user modules.
- Super Admin can create Employee, Reporting Manager, HR, IT and other enabled user accounts within authorised scope.
- Account creation generates a unique User ID and strong temporary password according to the agreed policy.
- The user must change the temporary password on first login, and plaintext passwords are not stored in PostgreSQL, application logs, reports or audit logs.
- Super Admin can reset credentials and activate/deactivate accounts according to permissions.
- Super Admin can configure locations, departments, designations and vacancies with capacity.
- An eligible employee can view permitted vacancies, submit a valid transfer request and receive a unique reference number.
- Reporting Manager and configured Receiving Manager can take permitted actions with decisions and reasons recorded.
- HR can validate eligibility, target organisation, vacancy/capacity and effective date; upload authorised documents; update/assign organisation metadata; and initiate applicable downstream tasks.
- IT and Facilities/Admin users can view and complete only assigned tasks within authorised scope.
- Each user can see assigned employees, requests and tasks according to role and organisation mapping.
- Every material configuration, security and workflow action creates the agreed audit record.
- Approved requests generate only applicable downstream actions; failures are visible and recoverable.
- The request reaches Completed only after all mandatory tasks satisfy the agreed completion rule.
- UAT scenarios cover account creation/login, credential reset, approval, rejection, clarification, capacity constraints, reassignment, document handling, integration failure and final completion.

23. Open decisions and change control

Before build approval, confirm the exact reviewer sequence, Receiving Manager requirement, HR eligibility rules, organisation hierarchy source, User ID convention, authentication model, password policy, initial credential delivery method, vacancy/capacity reservation rules, HR/IT/Facilities routing, organisation metadata fields, document categories and retention, payroll handoff behaviour, withdrawal rules, effective-date handling, integrations, service-level targets and data-retention requirements. Changes to agreed scope, interfaces, roles, security controls or acceptance criteria will be assessed for impact and approved through the project change-control process.
